The TGF beta-like proteins for 2 different types of TGF beta-1.8 TGF beta-1-3, TGF beta-2-3, etc, or bone morphogenic proteins e.g. BMP-2. The TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. am aild detergent (CHAPS) craft or digitionin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethyl sulphoxide), DMSO2 (dimethyl formamide). The detergent allows folding of the monomer such
               Non-soluble, monomeric transforming growth factor TGF-beta 2 (AAR92774) was recovered from E. coli LC 137 (DSM 5658) transformants carrying plasmid ppLMu.TGF-beta 2, which includes the coding sequence (AAT17236) for TGF-beta 2. A biologically active, dimeric form of TGF-beta 2 was obtd. by refolding this monomer in detergentfere buffer contg. DMSO and/or DMF. Dimers of TGF-beta 3 (AAR92772), and hybrid dimers (see also AAR92775-777),
                                                                                                                                                                                                                                                                           Gaps

```
that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional requiators of cellular activity and a typical use is to stimulate wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprises a purification tag and a TGF active fragment. The present sequence represents a specifically claimed TGF active fragment. The present additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag; proteinase site: GGF betta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular

This invention describes the novel preparation of biologically active dimers of recombinant. human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31.39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAYO8278-YO8301 are human growth factor protein fragments used in the method of the invention.

                                                                                                                                                           Gaps
                                                                                                                                                                                      9
                                                                                                                                                                                                human; dimer; cysteine knot; cellular inclusion body;
matrix binding site facilitates delivery of the fusion protein to t desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preparing active growth factor dimers from inclusion bodies in high

The present sequence represents the mature form of transforming growth factor-beta-2. Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimeric, biologically active TGF-beta-like protein, which is useful for the treatment of wounds (surface or internal) and cancer in a mammal, in bone and tissue repair, as a bone marrow protective agent, a mediator of cardioprotection, for the production of an anti-inflammatory or immunosuppressive preparation. Treatment is useful for animals, especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is particularly useful for the elderly.

```
The present sequence represents a transforming growth factor beta active fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic purification tag, a proteinase site, an SCM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment. The bone morphogenetic fusion proteins can be used for enhancing wound
                                                                                                                                              Proteinase site; bone morphogenetic fusion protein; bone binding site; bone morphogenetic protein; transforming growth factor beta; active fragment; wound healing; bone growth; purification tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New bone morphogenetic fusion proteins - comprising a purification tag and a bone morphogenetic active fragment, used for enhancing wound healing or bone growth
                                                                                                                 Transforming growth factor beta active fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Wu L;

Sequence

```
This is the wild type human transforming growth factor beta 2 monomer. Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bioactivity.

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor-beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutant transforming growth factor family proteins or analogues are useful for treatment of ovulatory dysfunction, luteal phase defect, unexplained infertility, time-limited conception and in assisted reproduction.
                                                                                                                                                                                                                                                                                                                                                                        uprionally mutated to increase electrostatic
interaction between beta hairpin structure and
a receptor"

This invention relates to a matrix comprising a substrate capable of providing attachment of a heparin binding peptide (HBP), a peptide, comprising a binding domain which binds heparin with high affinity, heparin or heparin-like polymer, and a protein growth factor or peptide fragment which has a domain that binds heparin with low affinity. Included in the invention is a vascular graft comprising the matrix, which is capable of supporting cell adhesion. The matrix is used for delivering low heparin binding affinity growth factor proteins or peptides in a controlled manner suitable for wound healing. The matrix can be used in an article for treating dermal wounds, and in an implantable sterilized composition capable of supporting cell adhesion. The present sequence represents a growth factor protein. The protein is used in an example illustrating that non-heparin-binding growth factors can be released in a controlled manner from heparin-based drug delivery systems based on their low affinity for heparin.

The present invention relates to growth differentiation factor-8 (GDF-8) coding sequences and proteins. The present sequence is a protein, which was used in a sequence homology comparison with the GDF-8 protein lisolated in the present invention. GDF-8 is useful for treating meurodegenerative diseases (e.g. amyotrophic lateral sclerosis and muscular dystrophy), musculodegenerative diseases or in tissue repair to trauma, obesity and disorders related to abnormal proliferation of adipocytes. GDF-8 is also useful for treating malignancies of the various organ systems, particularly cells in muscle or adipose tissues and in gene therapy for the treatment of cell proliferative or immunological diseases mediated by GDF-8. In addition, GDF-8 is also useful for treating muscle wasting disease, neuromuscular disorder, spinal cord injury, treatmatic injury, congestive obstructive pulmonary disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New substantially purified growth differentiation factor-8 polypeptide, useful for treating muscle wasting disease, obesity, muscular dystrophy, neuromuscular disorder, acquired immunodeficiency syndrome
                                                                                                                                                                                                                                                                                                                   Gene therapy; growth differentiation factor-8; GDF-8; AIDS; cachexia; neurodegenerative disease; amyotrophic lateral sclerosis; obesity; muscular dystrophy; musculodegenerative disease; tissue repair; muscle wasting disease; neuromuscular disorder; spinal cord injury; traumatic injury; congestive obstructive pulmonary disease.

IL1-beta;

```
Transforming growth factor-beta 2 (TGF-beta 2) has been found to inhibit inducible nitric oxide synthase (INOS) gene transcription, esp. in interleukin-1-beta (IL1-beta) stimulated rat smooth muscle cells, and a dose which does not inhibit consitutive NOS. TGF-beta 1 (AAR83054) or 2 or their active fragments (esp. derived from the carboxy-terminal 112 amino acids), can be used in the treatment of hypotension, such as that associated with severe inflammation or septic shock.
                                                                                                                                                                                                                                                             303..414

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Q
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                This sequence represents human transforming growth factor-beta 2 (TGF-beta 2). The sequences for human TGF-beta 1 (see AAR73596) and human TGF-beta 3 (see AAR73598) are claimed within the scope of the invention. The invention is a composition consisting of a TGF-beta protein and an osteogenic cell source (OCS) formulated in an acceptable carrier other than a bone morphogenic cofactor. This composition can be used for the restoration of bone deficiency. This provides for the generation of mature bone only where it is required, without the inclusion of a specific bone-inducing cofactor. This method can be used with any of the 5 human TGF-beta's or with TGF-beta from other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transforming growth factor-beta; Human TGF-beta protein; TGF-beta 1; TGF-beta 2; TGF-beta 3; osteogenic cell source; OCS; bone deficiency;

```
PolyA-RNA was isolated from the tamoxifen-treated, human prostatic adenocarcinoma line PC-3 and converted to cDNA. TGF DNA is pref. used for control of the SV40 promoter. and expressed in CHO cells.
                                                                                                                                                                                                                         1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

Peptide

```
Transforming growth factor; TGF; TGF-beta; TGF-5 beta; simian; Simian virus 40; SV40; expression vector; Chinese Hamster ovary; CHO; vascular endothelial cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TGF-Beta2 may be used in treatment of tumors at effective doses, and may also be useful in augmenting wound healing by stimulating cell proliferation. The growth factor can be produced at high levels from a CHO expression system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 ALDINYCFRNLEENCCVRPLYIDFRODLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST
                                                                                                                                                                                                                                              Cloning and expression of transforming growth factor beta 2 - used for treatment of tumors or for augmenting wound healing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This hybrid sequence is expressed in a host cell, preferably a COS or CHO cell, so th host cell produces active TGF-beta2. The produced TGF-beta2 protein can be used to regulate cellular differentiation and proliferation.
                                    Simian-human hybrid TGF-beta1/TGF-beta2 precursor protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence given is a hybrid transforming growth factor (TGF)-beta termed TGF-beta 1/beta 2 (or TGF-5 beta). The mutations indicated in the features table represent replacements of TGF-beta Iresidues with those from the corresponding positions of TGF-beta 2. The DNA sequence encoding this protein could be placed under the control of Simian virus 40 (SV40) expression regulatory region within an expression vector and used to transfect Chinese Hamster ovary (CHO) cells. CHO transfectants can be seen to synthesise and secrete high levels of mature TGF-5 beta. TGF-5 beta induces effects on the proliferation of vascular endothelial cells equivalent to those produced by TGF-beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This sequence is that of mature human transforming growth factor-beta 1 (TGF-beta 1) polypeptide. It differs from human and porcine TGF-beta subtype 3 sequences at positions 9-11,13,19,40,45,52,57,57,58,60,58,68,71,75,82,87,and 95. In addition porcine TGF-beta 3 has an AA substitution at posn. 96. The N-terminal AA sequence of bovine TGF-beta 2 differs from that of human TGF-beta 1 at posns.4,5,9-13,and 19.

The nucleic acid sequence encoding the second subtype of TGF-beta (TGF-beta 3) is useful as a probe or trop produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                Nucleotide sequence encoding transforming growth factor beta-3 used as a probe, or to produce TGF beta 3, for inhibiting growth of certain normal and neoplastic cells, eg A549.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The TGF-beta may be used to derive cartilage inducing factors (CIFs) useful for inhibition of acute/chronic inflammation, treatment of red blood cell dysfunction associated with polycythemia, thrombocytosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 ALDITNYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

It can be obtd. by treating transforming growth factor (TGF) beta with chymotrypsin or pepsin, or can be isolated from human blood platelets or by recombinant expression of DNA obtd. using RNA extd. from blood plasma. PDGI alpha is comprised of subunits a, b and c bonded b-a.c. pDGI alpha can be used for controlling cell proliferation without the cancerous activity (transformation activity) associated with TGF-beta. PGFI-alpha can be used for activation and acceleration of the proliferation of epithelium cells in treating eczema, for stimulating osseous growth for bone formation or as an immuno-suppressant for immune diseases.

```
The mature form of TGF-beta is comprised of two identical chains, each of 112 amino acids. Since TGF-beta is a regulator of scar prodn. after a penetrating injury to the brain or spinal cord, which scar prodn. can preclude neuronal recovery, TGF-beta antagonists have potential use as adjuncts to those therapies designed to promote regeneration and reconnection of damaged neural pathways.

Non-soluble, monomeric transforming growth factor TGF-beta 1 (AARQ2773) was recovered from E. coli LC 137 (DSM 5658) transformants carrying plasmid ppLMu-TGF-beta 1, which includes the coding sequence (AAT17235) for TGF-beta 1. A biologically active, dimeric form of TGF-beta 1 was obtd. by refolding this monomer in detergentiree buffer contg. DMSO and/or DMF. Dimers of TGF-beta 2 (AAR92774) and TGF-beta 3 (AAR92772), and hybrid dimers (see also AAR92775), were also produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST

Growth factor (TGF) beta-1, TGF beta-2 and TGF beta-3 which are used to growth factor (TGF) beta-1, TGF beta-2 and TGF beta-3 which are used to produce TGF beta-1ike proteins in dimeric form. The TGF beta-1ike proteins produced are hybrids of 2 different types of TGF beta-6.

TGF beta-1-3, TGF beta-2-3, etc, or bone morphogenic proteins e.g. BMP-2. The TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta-1ike proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSC (dimethyl sulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional regulators of cellular activity and a typical use is to stimulate wound healing.

```
A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. The present sequence represents a specifically claimed TGF-betal active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase some or all of the following elements: purification tag:proteinase site:TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are useful in pharmaceutical compositions and the method provides yields of 31-39.78, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAX082778-Y08301 are human growth factor protein fragments used in the method of the invention.
This is the amino acid sequence of human transforming growth factor beta-1 (TGF-beta 1, see also AAW78785). The sequence shows homology to human TGF-beta 3 (see AAW78782), porcine TGF-beta 3 (see AAW78784) and bovine TGF-beta 2 (see AAW78784) N·terminal sequences. The invention relates to the recombinant production of TGF-beta. DNA encoding TGF-beta has been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from transformed cells can be used in known
                                                                                                                                                                                                                                                                                              1 ALDINYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

Dimensic, biologically active TGB-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimensic, biologically active TGF-beta-like protein, which is useful for the treatment of wounds (surface or internal) and cancer in a mammal, in bone and tissue repair, as a bone marrow protective agent, a mediator of cardioprotection, for the production of an anti-inflammatory or immunosuppressive preparation. Treatment is useful for animals, especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is particularly useful for the elderly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents the mature form of transforming growth

The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic pusion proteins are purification tag, a proteinses site, an ECM/bone binding site, a second proteinse site, and a bone morphogenetic protein active fragment.
                                                                                                                                                                                             Proteinase site; bone morphogenetic fusion protein; bone binding site; bone morphogenetic protein; transforming growth factor beta; active fragment; wound healing; bone growth; purification tag.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New bone morphogenetic fusion proteins - comprising a purification tag and a bone morphogenetic active fragment, used for enhancing wound healing or bone growth

Mutants comprise at least one electrostatic charge altering mutation in a beta hairpin loop, resulting in increased bloactivity.

Mutant cystine knot growth factor (CKGF) proteins comprising one or more mutant subunits and having novel properties or improved pharmacological properties, compared to wild type CKGFs, are claimed. The CKGF superfamily comprises at least four families of growth factors: the glycoprotein hormones, the platelet-derived growth factor (PDGF) family, the neurotrophins and the transforming growth factor beta family; the families are known to be structurally similar (especially comprising the cystine knot topology) and it was shown that mutations at certain positions in the CKGF hairpin loops of family members and other members of the CKGF superfamily could significantly alter the biological mutant transforming growth factor family proteins or analogues are useful
                                                                                                                                                                                                           /note= "optionally mutated to increase electrostatic interaction between beta hairpin structure and a receptor"
                                                                                                                                                                                                                                                                                                                                           /note= "optionally mutated to increase electrostatic interaction between beta hairpin structure and a receptor"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "optionally mutated to increase electrostatic interaction between beta hairpin structure and a receptor"

ö
for treatment of ovulatory dysfunction, luteal phase defect, unexplained infertility, time-limited conception and in assisted reproduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes the a method for screening potential inhibitors of the expression of the Pax4 gene by contacting the potential inhibitor with pancreatic beta cells and measuring the expression of the gene in these cells is new. Substances identified by the screening method potentiate the expression of the Pax4 gene in pancreatic beta cells and accelerate the expression of the Pax4 gene in those cells. The method can be used in the treatment of disorders in which the exhaustion of pancreatic beta cells is involved, such as diabetes. The present sequence represents the human transforming growth factor protein which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; transforming growth factor; Pax4 gene; expression; potentiator; insulin; pancreatic beta cell; diabetes.

providing attachment of a hearin binding peptide (HBP), a peptide comprising a binding domain which binds heparin with high affinity, heparin or heparin-like polymer, and a protein growth factor or peptide fragment which has a domain that binds heparin with low affinity, included in the invention is a vascular graft comprising the matrix, which is capable of supporting cell adhesion. The matrix is used for peptides in a controlled manner suitable for wound healing. The matrix can be used in an article for treating dermal wounds, and in an implantable sterilized composition capable of supporting cell adhesion. The present sequence represents a growth factor protein. The present sequence represents a growth factor protein. The protein is used in an example illustrating that non-heparin-based drug delivery

The present sequence is a protein, which was used in a sequence homology comparison with the GDF-8 protein isolated in the present invention. GDF-8 is useful for treating meurodegenerative diseases (e.g. amyotrophic lateral sclerosis and muscular dystrophy), musculodegenerative diseases or in tissue repair due to trauma, obesity and disorders related to abnormal proliferation of adipocytes. GDF-8 is also useful for treating malignancies of the various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New substantially purified growth differentiation factor-8 polypeptide, useful for treating muscle wasting disease, obesity, muscular dystrophy, neuromuscular disorder, acquired immunodeficiency syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          organ systems, particularly cells in muscle or adipose tissues and in gene therapy for the treatment of cell proliferative or immunological diseases mediated by GDF-8. In addition, GDF-8 is also useful for treating muscle wastling disease, neuromuscular disorder, spinal cord injury, traumatic injury, congestive obstructive pulmonary disease (COPD), AIDS or cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gene therapy, growth differentiation factor-8; GDF-8; AIDS; cachexia; neurodegenerative disease; amyotrophic lateral sclerosis; obesity; muscular dystrophy; musculodegenerative disease; tissue repair; muscle wasting disease; neuromuscular disorder; spinal cord injury;

```
The present sequence represents a novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag (shown in AAW01825) and a TGF active fragment (shown in AAW0173). Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the fusion protein may comprise proteinase site; ECM binding site: FGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site (facilitates delivery of the fusion protein to the desired site of action belivery of the TGF-beta to the site to be treated reduces the amount of the protein ministered to be defective and reduces the amount of the protein ministered to be effective and reduces the amount of the protein ministered to be effective and reduces the amount of the protein ministered to be effective and reduces the amount of the desired actions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     concentration of circulating TGF-beta which may result in undesirable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prepn. of transforming growth factor-beta fusion protein - useful to reduce surgery recovery time and to prepare artificial skin \,

                                                                                                                                                                                                                                                                                                                                                       δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the collowing elements: purification tag;proteinase site:ECM binding site: proteinase site:ECM-beta. The present sequence represents a fusion protein made up from a purification tag (AAM18225), a proteinase site: (AAW08169) and a TGF active fragment (AAW08173). TGF-beta promotes wound healing, and the fusion protein on be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta

A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag;proteinase site:ECM binding site:proteinase site:TGF-beta. The present sequence represents a fusion protein made up from a purification tag (AAM18225), a proteinase site

Would healing, and the fusion protein can be used to reduce surgery wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.

N.B. The present sequence is does not appear in the specification, but is derived from the sequences mentioned above.

```
comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag; proteinase site:ECM binding site: protein made up from a purification tag (AAM18225), a proteinase site:TGF-beta. The present sequence represents a fusion protein made up from a purification tag (AAM18225), a proteinase site (AAW08159), an extracellular matrix binding site (AAW08171) and a TGF active fragment (AAW08173). TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artifical skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the fusion protein to be treated reduces the amount of TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and reduces the concentration of circulating TGF-beta which may result in undesirable effects.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŏ
                                                                                                                                                                                                                                  comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the full of proteinase site: ECM binding site: proteinase site: ECM binding site: proteinase site: TGF-ber. The present sequence represents a fusion protein made up from a purification tag (AAMU8225), a proteinase site: (AAW08173), an extracellular matrix binding site (AAW08171) and a TGF cusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification from protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta equired to be administered to be effective and reduces the concentration of circulating TGF-beta which may

comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase sensitive linker sites and biding domain so the protein sequence may contain some or all of the binding domain so the protein tag. Proteinase site:ECM binding site: proteinase site:ECF-beta. The present sequence represents a fusion protein made up from a purification tag:proteinase site:ECM binding site: protein made up from a purification tag (AAMN8125), a proteinase site (AAW08169), an extracellular matrix binding site (AAW08169), an extracellular matrix binding site (AAW08172) and a TGF active fragment (AAW08173). TGF-beta promotes wound healing, and the preparation of artificial skin. The inclusion of a purification tag is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of TGF-beta fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the reduces the cancent the concentration of circulating TGF-beta which may result in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

```
A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site: Following elements: purification tag:proteinase site:ECM binding site: proteinase site: TGF-beta. The present sequence represents a fusion protein made up from a purification tag (AAMU8125), a proteinase site (AAW08169) and a TGF active fragment (AAW08173).

TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The proteinses site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein. The proteinses site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the cattered reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating the present sequence is does not appear in the specification, which the present sequence is does not appear in the specification,

Sequence

```
A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site: proteinase site:TGF-beta. The present sequence represents a fusion protein made up from a purification tag (AAM18225), a proteinase site (AAW08170), an extracellular matrix binding site (AAW08172) and a TGF active fragment (AAW08173). TGF-beta promotes wound healing, and the

fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.

```
comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site: proteinase site:TGF-beta. The present sequence represents a fusion protein made up from a purification tag: (AAM08125), a proteinase site (AAM08169) and a TGF active fragment (AAM0817), an extracellular matrix binding site (AAM0817), another proteinase site (AAM08169) and a TGF active fragment (AAM0817).

TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the customer the proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating and the property of the TGF-beta required to be administered to be effective and reduces the concentration of circulating and the property of the top top the tage of the property of the tage of tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
Prepn. of transforming growth factor-beta fusion protein - useful to reduce surgery recovery time and to prepare artificial skin \,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 ALDTNYCFRNLEENCCVRPLYIDFRQDLGWKWVHEPKGYYANFCSGPCPYLRSADTTHST 60

```
Anovel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the binding domain so the protein sequence may contain some or all of the collowing elements: purification tag.proteinase site:ECM binding site: Collowing elements: purification tag.proteinase site a fusion protein made up from a purification tag (AAM08125), a proteinase site (AAW08169), an extracellular matrix binding site (AAW08170) and a TGF active fragment (AAW08173).

CTGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin.

CTGF-beta promotes wound healing, and the fusion protein of the collision of the proteinses site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating concentration may result in undesirable effects.

N.B. The present sequences mentioned above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

```
Anovel transforming growth factor-beta (TGF-beta) fusion protein

Comprises a purification tag and a TGF active fragment. Additionally,
the fusion protein may comprise proteinsae-sensitive linker sites and
binding domain so the protein sequence may contain some or all of the
binding domain so the protein sequence may contain some or all of the
Collowing elements: purification tag:proteinase site:ECM binding site:
Collowing elements: purification tag:proteinase site fusion

Collowing elements: purification tag (AAM/8215), a proteinase site
CC (AAW/8169), an extracellular matrix binding site (AAW/8172), another
CC (AAW/8169), an extracellular matrix binding site (AAW/8173).
CTGF-beta promotes wound healing, and the fusion protein can be used to
creduce surgery recovery time and in the preparation of artificial skin.
CC TGF-beta promotes wound healing, and the fusion protein can be used to
creduce surgery recovery time and in the preparation of a purification tag facilitates purification of the fusion
CC TGF-beta promotes alterial active to permit cleavage and
crelease of the purification tag after purification if desired. The
crelease of the purification and reduces the required to be
concentrated to be effective and reduces the concentration of circulating
CTGF-beta which may result in undesirable effects.

N.B. The present sequence is does not appear in the specification,
collowing the protein to the sequences mentioned above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

comprises a purification tag and a TGF active fragment. Additionally,
the fusion protein may comprise proteinase sensitive linker sites and
binding domain so the protein sequence may contain some or all of the
collowing elements: purification tag:proteinase site:ECM binding site:
Collowing elements: purification tag:proteinase site:ECM binding site:
Collowing elements: purification tag:proteinase site fusion
contains site: GARW08170) and a TGF active fragment (AAW08171), another
contains site (AAW08170), and a TGF active fragment (AAW08173).

TGF-beta promotes wound healing, and the fusion protein can be used to
reduce surgery recovery time and in the preparation of artificial skin.
TGF-beta promotes wound healing, and the fusion protein can be used to
reduce surgery recovery time and in the preparation of artificial skin.
TGF-beta promotes matrification tag after purification if desired. The
fusion protein The proteinase site is included to permit cleavage and
release of the purification tag after purification if desired. The
content matrix binding site facilitates delivery of the fusion
protein to the desired site of action. Delivery of the TGF-beta to the
site to be treated reduces the amount of TGF-beta required to be
contential to be effective and reduces the concentration of circulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prepn. of transforming growth factor-beta fusion protein - useful to reduce surgery recovery time and to prepare artificial skin \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      12-DEC-1996,
```

the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag; proteinase site: ECM binding site: proteinase site: TGF-beta. The present sequence represents a fusion protein made up from a purification tag (AAWN8125), a proteinase site (AAWN8170), an extracellular matrix binding site (AAWN8173), another proteinase site (AAWN8170), an extracellular matrix binding site (AAWN8173), another proteinase site (AAWN8173) and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the tusion protein. The proteinase site is included to permit cleavage and extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be continued and in undestrable effects.

N.B. The present sequence is does not appear in the specification, but is derived from the sequences mentioned above. 137 AA; Sequence \$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$
